

My Open Source Projects : BeanManager

This page last changed on gen 17, 2008 by [admin](#).

Introduction

The BeanManager is a framework that helps to deal with Object Relational Mapping problem. The major features are outlined below:

- Small footprint about 72KB
- No external dependencies
- JDK 1.5/6 compliant
- JDBC compliant
- Based on JavaBean specification, mapping is expressed as BeanInfo
- Support of both mutable metadata and dynamic bean - (configurability/extensibility features)
- support of inheritance
- support of SQL92 specification
- support of simple query language
- support of aggregation (i.e. a single bean mapped on more than one table)
- Custom adapter to customize Java to DB representation and vice-versa
